Ethical considerations

- **Informed Consent**

- *Participants must provide informed consent before contributing data to the platform. This includes understanding the purpose of the research, how their data will be used, and any potential risks involved. They should also be aware that their GPS data can reveal sensitive information about their location and movement patterns.*
- *Informed consent in this context will be implemented through a consent form/agreement within the app, explaining data collection practices, data storage, and their right to withdraw at any time.*

- **Anonymity and Privacy**

- *Given that GPS data is sensitive and can identify users' locations, strong privacy protections are necessary. This includes anonymizing any personally identifiable information (PII) to prevent unauthorized parties from linking data back to individuals.*

- **Data Security**

- All data transmissions will be encrypted, and data will be stored on secure servers. Access to raw data will be restricted to authorized research personnel only using Firebase's built-in security features, such as authentication and access control (via security rules).

- **Participant Rights**

- *Participants will be informed of their rights to access, modify, or delete their data. Transparency is crucial, particularly in communicating the data's purpose, potential uses, and retention period.*

- **Use of Crowdsourced Data**

- The research team will use the collected data solely for the purposes outlined to participants. Data should not be repurposed for unrelated studies or commercial exploitation without additional consent.

To the best of our knowledge, the ethical issues listed above have been addressed in the research.
